How will schools change in the future?

Have you ever imagined walking by a classroom and notice the robots are teaching math problems, and textbooks are replaced by ipad/tablets? There are many ways that schools would change but the most significant change will probably be the usage of artificial intelligence or AI. AI could be used by the teachers to teach or help students in learning at their own pace. Text books and workbooks could be replaced with iPads and computers, at the same time whiteboards could be replaced by large interactive TVs. However, improvements will be needed to manage the use of technology effectively. Finally, schools may replace exams and tests with projects and experiments. These are some ways schools could change over the years.

Schools in the future will probably use artificial intelligence a lot. This is because artificial intelligence is more advanced than humans in many ways allowing it to do anything. AI could act like a human teacher that could teach personalized topics to students. It could teach children in a virtual reality (VR) environment that would make learning easier. Instead of having one AI teach a whole classroom of a large group of students at the same time, it could teach each student individually on their own specific problems. However, there might be problems. Imagine a student is guided through submitting an essay in VR and the system fails and the student may not know how to complete the task on their own. A solution is for students to learn the basics before using a VR. In summary AI has the potential to improve schools and the way they teach.

Electronic devices are going to end the use of books. When you look into a book, you try to find a page you want to study. However, it takes a long time to find and you probably won't understand what is happening after you read it. An electronic device like an ipad can help you easily by just searching it up. Plus carrying heavy books down and up the school stairs is exhausting and burdensome. Another way electronic devices are helpful is that it can help you when you are sick. It can help by having your teacher host an online meeting so you can be in class but not physically. However, using an electronic device too much may reduce interaction with teachers and classmates, which can affect communication towards people. A solution for that is to reduce technology usage so students don't depend on it too much. After all, schools in the future could replace books with electronic devices.

Finally, another way schools will change in the future is that there won't be any exams or tests. Instead, schools will help students understand important topics. Instead of tests, students will work on doing projects, experiments, and solving real-world problems. With the use of AI there could be challenges for students to behave honestly. Overall in our future, exams/tests could be taken out of our education system.

In conclusion, Schools in the future could change in a matter of ways. The main 3 changes are an introduction to AI, books being replaced by technology, and exams/tests are going to disappear. This summarises how schools could change in the future.
